

Constructors

27 June 2026 10:22

Before staring constructors:

```
Student s1= new Student();  
s1.age=10;  
s1.name="Raj";  
s1.marks=32;
```

What if we need to create 100 student object ?
Do we need to assign every field separately every time ?

Note:

Syntax:

```
ClassNam()  
{  
  
}
```

1. When we create any class by default one constructor is there is called constructor without parameter
2. If we mention our customized constructor then jvm give preference to it
3. We class have customized constructor and we want to use default constructor then we need to create it
4. Default constructor used to initialize **instance** variable default value
5. We want to give customizer values to our instance variables while object creation in this case we need constructor with multiple parameter

Break : 10:45 ----> 11:05
